Keerthan Reddy, and Lakpa Dolma Sherpa

University of Mannheim, Germany

1 Introduction

2 Phase I: Data Collection and Data Translation

Sources considered but not used. We examined four further sources and decided against them. *DBpedia* [Lehmann et al., 2015]: its 27,728 universities are extracted from the English Wikipedia, on which Wikidata partly draws as well. Of the linked Wikidata–DBpedia pairs, 63% have coordinates that are identical to about ten metres, so DBpedia is not sufficiently distinct from Wikidata. *OpenStreetMap* [OpenStreetMap contributors, 2026]: its 47,706 universities are independent of Wikidata (only 4% of the linked pairs have coordinates that are identical to about ten metres), but beyond the name and the location they are sparsely described: a website and a city are given for a third of them and a founding year for 2%, and the tag also covers single faculties and buildings. *University rankings*: we retrieved the Times Higher Education World University Rankings 2026 [THE, 2025] and, before that, the QS ranking. THE lists only 3,118 institutions, against more than 20,000 in each of our other sources, so a rank, a score or a subject list would be missing for most universities of the integrated dataset. The overlap of the schemata is small as well: besides the name, THE shares only the country and the number of students with the other sources. *The Hipo university domains list* [Hipo, 2026]: its 10,224 records hold a name, a country, a state or province (filled for 13% of the records) and the websites of a university. By website or exact name, 82% of its universities are already contained in ROR, and every one of its attributes is already supplied by our other sources, so it would add no new information to the integrated dataset.

3 Phase II: Identity Resolution

4 Phase III: Data Fusion

5 Summary
